

# The Blu900 Mesh Solution

 [sales@yieldpoint.com](mailto:sales@yieldpoint.com)

 +1-613-531-4722

## Features:

- (i) 900MHz mesh radio based on Digi 900HP radio
- (ii) Bluetooth BT5.2 on each module that will listen to advertising beacons from BluTech Ecosystem.
- (iii) 900MHz Settings configurable from BluPoint App.
- (iv) Local data-logging and buffering 30k readings, download over BT5 to BluPoint App.
- (v) Over-the-Air (OTA) firmware updates.
- (vi) Battery powered (4 or 8 D-cell)  
2 years min at 1 reading/hr.
- (vii) External power and PoE available.
- (viii) Detailed Health Monitoring.

# Blu900 Solution for OT

OT has used YP's 900MHz 1F1 radio solution for several years now. YP's BluTech adventure started at OT where engineers asked Whether BT devices could be used to manage telemetry systems in 2019.

Blu900 has been developed as a powerful successor to 1F1. It is based on BlueTooth 5.2 enabled CPU (ARM Cortex M3 and M33) which combine high performance and low power consumption.

# Blu900 Solution for OT

The implementation of Bluetooth 5 with the 1F1 radio offers  
Several conveniences:

1. Bluetooth can be used to configure the Blu900 Nodes
2. The Blu900 nodes are now dataloggers and the data can be downloaded to an Android device over BT
3. Low cost BluLinks can beacon data away from dangerous locations without adding to the complexity of the 900MHz mesh.
4. FW updates can be written to future-proof the products.

# Blu900 Solution: Getting Started

In September 2023 YP has finished FW and Android development of the Blu900 solution.

It will be necessary to upgrade the FW on existing gateways and nodes. All the files need are bundled with the BluPoint Android APK from the Google Play store

1. Update FW (OTA Update) on Blu900 GW CPU
2. Update the Firmare on the ESP32 Wifi Modem
3. Update FW (OTA Update) on Blu900 Node

*Instruction are provided below.*

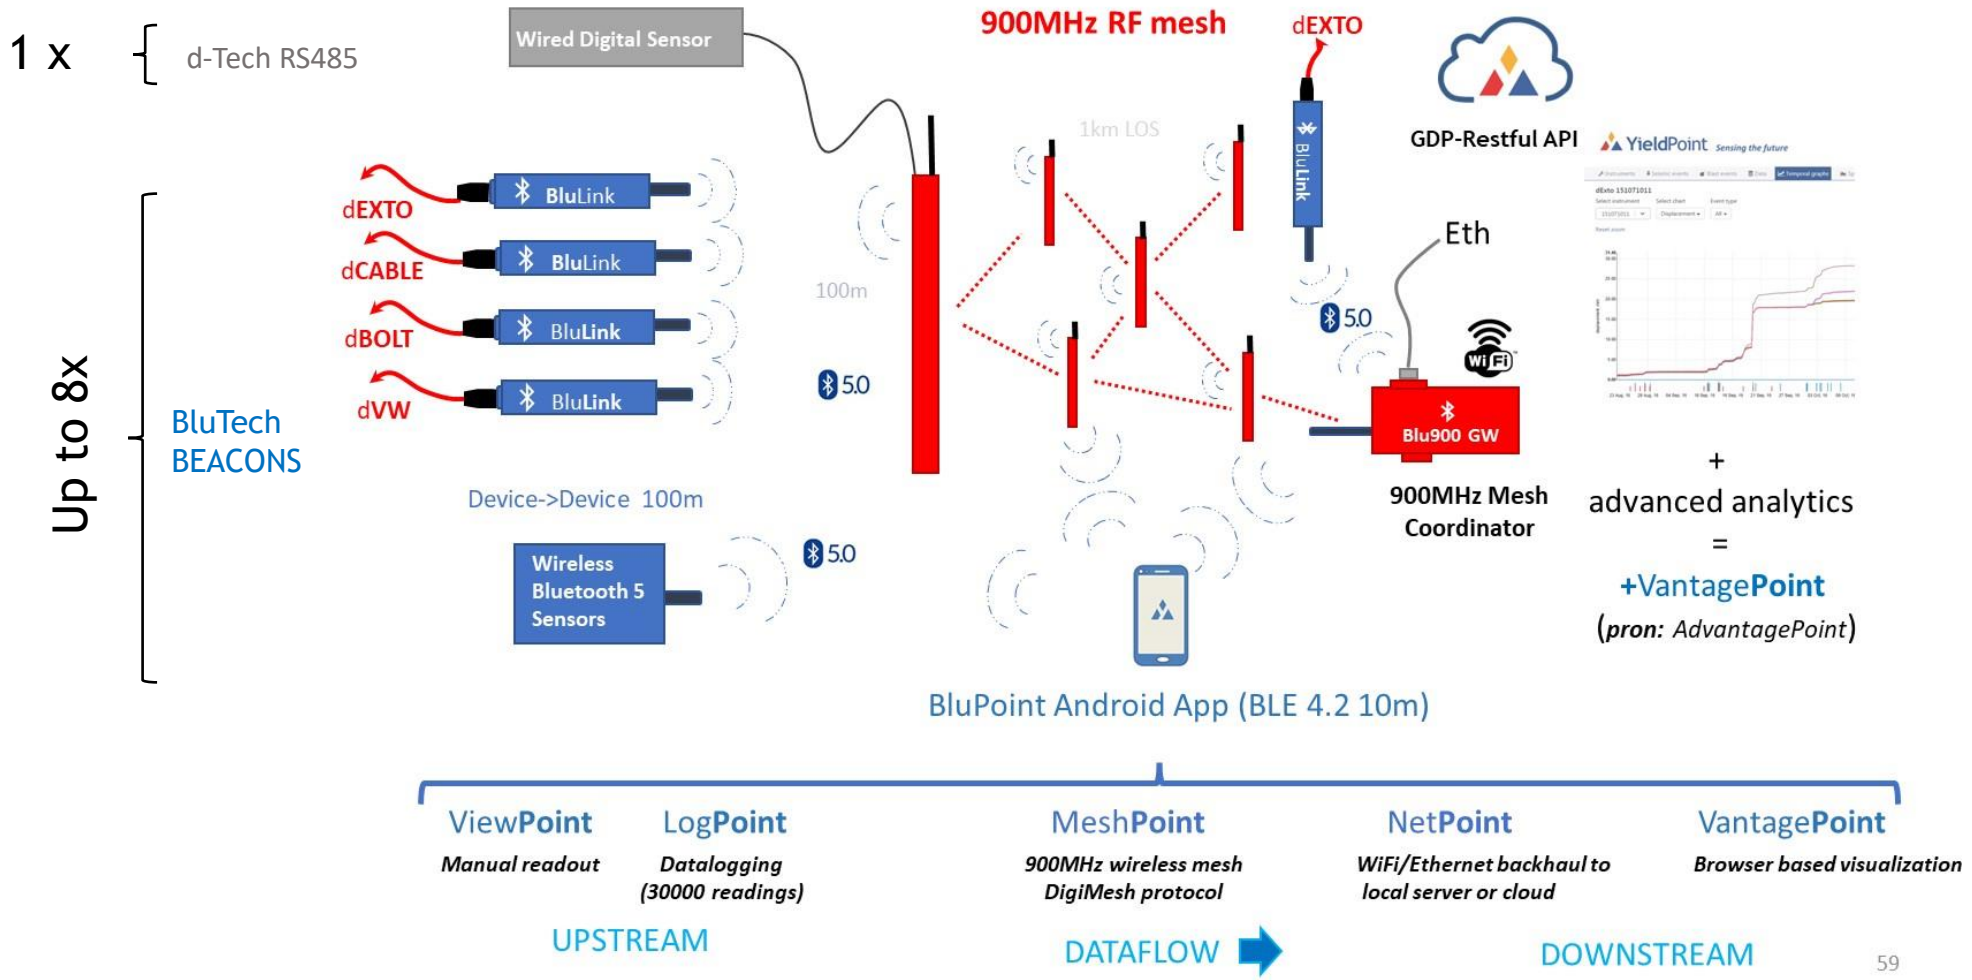

## Outline:

1. [Hardware](#)
2. [Principles](#)
3. [The BluPoint App](#)
4. [Blu900GW Browser configuration](#)
5. [Health Monitoring](#)
6. [Blu900GW FW Update](#)
7. [WiFi Modem FW Update](#)
8. [Restart a Blu900 mesh](#)

# Architecture

# The Blu900 Gateway

The Blu900 GW is normally externally powered. It has 4 x D-cell batteries as a backup

Types of Blu900 GW:

1. 12V power supply + 4 x D-cell Battery lithium preferred.
2. 12V power supply, available from YieldPoint.
3. PoE up to 57V.

Note: if equipped with more than one power source, Blu900 GW will run off the source with the highest voltage value.

# Three form factors for the Blu900Node

The Blu900 Node is a BluTech SCANNER that reads from:

- (i) 1 x Blu-Tech instrument
- (ii) Up to 16 x BluTech BEACONS

It has 3 form factors:

1. Enclosure - 4 x D-cell (lithium or alkaline)
2. Borehole radio - 4 x D-cell (lithium or alkaline)
3. Borehole radio - 8 x D-cell (lithium or alkaline)

# The 900 MHz & 2.4 GHz (BT) Antenna

It is imperative that the correct antenna be used for the radio.  
900MHz antenna.

The standard antenna has a +1dB Gain.

IMPORTANT:

Female connector on 900MHz Node antenna.

Male connector on 900MHz Gateway antenna.

Antenna always shipped with hardware.

900MHz

Bluetooth 2.4GHz

**IMPORTANT: Always check the gender of the antenna versus that of its connector.**

# Antenna performance

Antenna location is important for optimal performance. The following suggestions will help you achieve optimal antenna performance.

- Point the antenna up vertically (upright). Antennas radiate and receive the best signal perpendicular to the direction they point, so a vertical antenna's omnidirectional radiation pattern is strongest across the horizon.
- Position the antennas away from metal objects whenever possible. Metal objects between the transmitter and receiver can block the radiation path or reduce the transmission distance. Objects that are often overlooked include:
  - Metal poles
  - Metal studs
  - Structural concrete beams, which is usually reinforced with metal rods
- If you place the device inside a metal enclosure, use an external antenna. Common objects that have metal enclosures include:
  - Metal poles
  - Vehicles
  - Elevators
  - Ventilation ducts
  - RefrigeratorsHardware power, and signal planes are vacant immediately below the antenna section.

# Batteries for a Blu900 Node

Nodes are always and only battery powered.

They only use primary batteries, not rechargeable batteries.

The 900MHz node can operate from 4 or 8 x Lithium (preferred) or Alkaline (lower capacity) D-Cells

The nominal voltage for a single alkaline D-Cell is 1.5V and for a lithium is 3.6V.

4 x D-cell Alkaline = 6V

4 x D-cell Lithium = 14.4V

Both chemistries have a capacity around 18,000mAhrs which corresponds to 27Whr for alkaline and 64.8Whrs for lithium.

Lithium primary batteries will last 2.4x as long as alkaline and perform much better under sub-zero temperatures.

Alkaline  
1.5V 17000mAh

Lithium primary  
3.6V 18000mAh

- (Blk)

+ (Red)

# Power up the Blu900 Gateway

Option 1: 12V DC. Power supply provided by YieldPoint upon request.

Option 1: PoE for PoE Blu900 GWs only. PoE can be an external or an internal option.

# The Red (Associate) LEDs on Nodes and Gateways

The Red LED on a Blu900 Node or Gateway provides an indication of the device's sleep status and diagnostic information.

The Red LED indicates the synchronization status of a sleep compatible 900MHz RF Module.

## Blu900 Node LED

**Blinking fast (250ms)**

The Blu900Node is properly synchronized with the network. The mesh is awake.

Off

The Blu900 Node is in low power mode. The mesh is asleep.

## Blu900 GW

**Blinking Fast (500ms)**

The Blu900GW is properly synchronized. The mesh is awake.

**On (solid)**

The mesh is asleep and synchronized.

# 10 Key Principles

YieldPoint's Blu900 solution is based on Digi International's 900HP wireless module.

The full manual is here:

<https://hub.digi.com/support/products/digi-xbee/digi-xbee-pro-900hp/?path=/support/asset/xbee-pro-900hp-and-xsc-rf-modules-user-guide/>

The main operating principles are explained below:

1. [Coordinator and Nodes](#)
2. [Status indicators](#)
3. [Mesh ID](#)
4. [RSSI and Radio Tx Power](#)
5. [Mesh Cycle Settings](#)
6. [Mesh Cycle Operation](#)
7. [Mesh Cycle/ Reading Interval Synchronization](#)
8. [BluLinks on a Blu900 mesh](#)
9. [Mesh Optimization and max\\_tx Setting](#)
10. [Cloud Upload to VantagePoint](#)

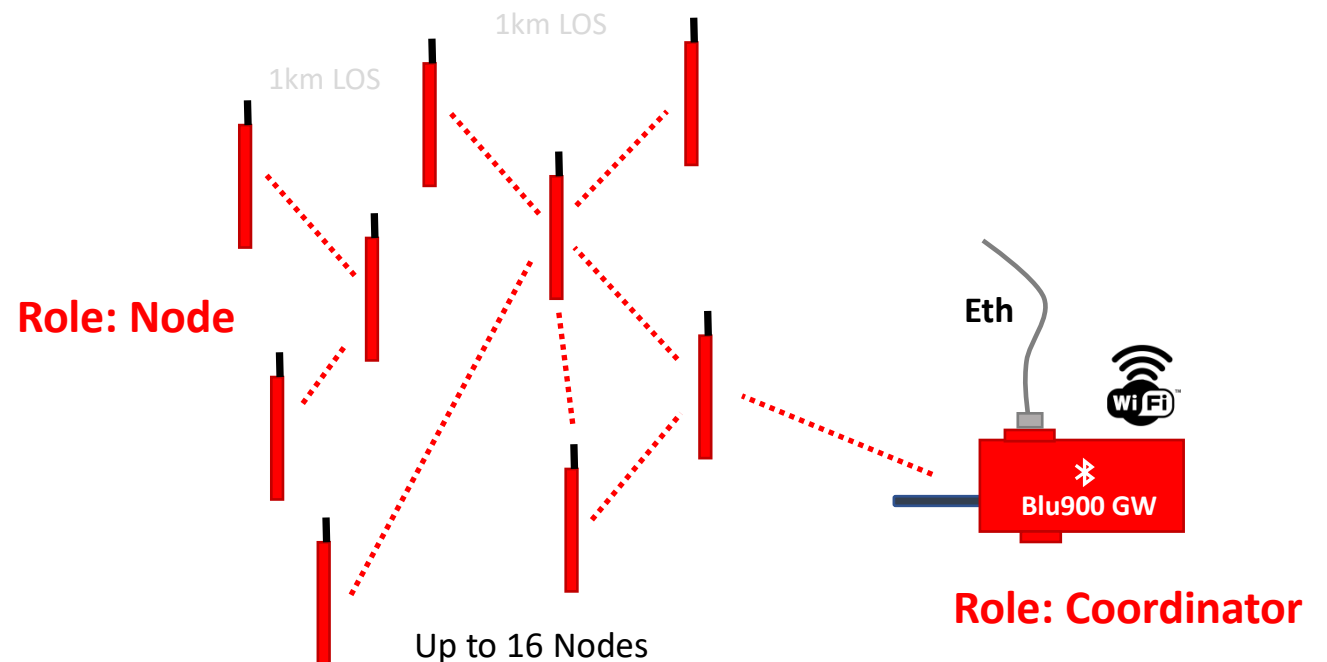

# # 1: Coordinator & Nodes

A Blu900 GW has an internal 900MHz radio that is configured to be the preferred **Coordinator**.

For a Blu900 mesh a Coordinator is a Master Radio that is permanently powered up. It controls and synchronizes the **Mesh Cycle**. There can only be one Coordinator for a mesh.

Blu900 **Nodes** are battery powered devices that can self-configure as a mesh. They wake up and sleep according to a schedule defined by the Coordinator (Blu900GW).

Blu900 Nodes are SCANNERS can take simultaneous readings from (i) a d-Tech instrument and (ii) 8 x BluTech BEACON cluster.

**Nodes**  
Synchronous Sleep  
Battery Powered

**Coordinator**  
Always Awake:  
Mains powered or  
PoE (specify).

# # 2 : Status Indicators

The Blu900GW is a 3-way “bridge” between the 900MHz mesh (coordinator), a WiFi/Ethernet (IP host) and a BT4.2 Android device (phone or tablet).

## Device Status: Idle

Preparing for Mesh Wakeup

Coordinate Mesh

Read Instrument

Scan BT

/low power mode

/ 10sec window where certain tasks are disabled

/ talk to the 900MHz mesh

/Read d-Tech instrument

/Scan for BT5 beacons

## Mesh Status: No Mesh

Sleep (HH:MM:SS countdown until wakeup)

Awake

## BT Status: Connected or Disconnected

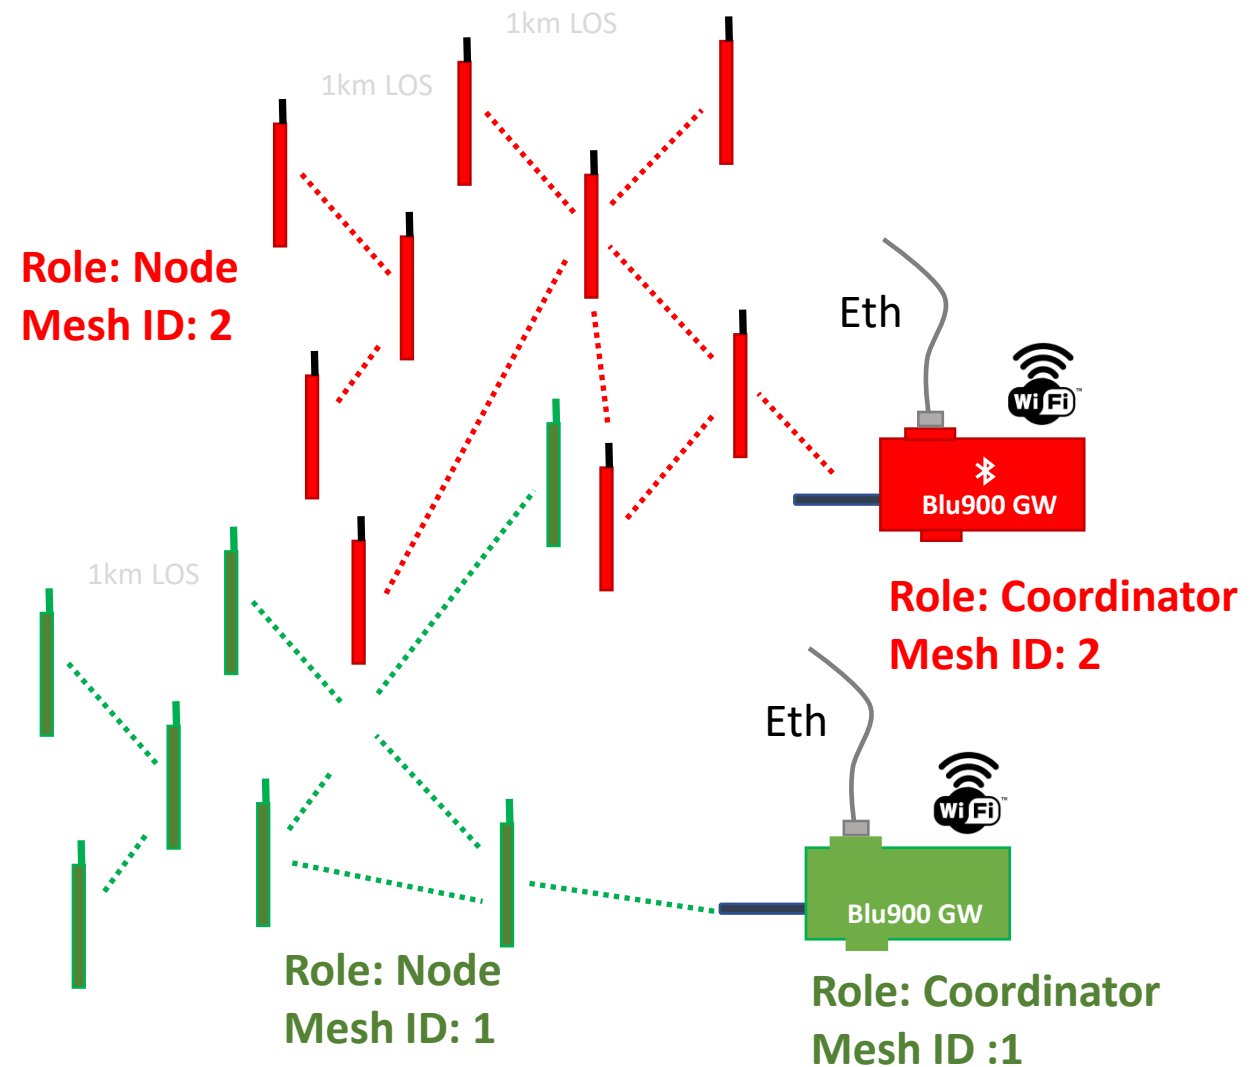

## # 3. Mesh ID

**Mesh ID** (Preamble ID in the older Digimesh) is an ID for devices that communicate together as a mesh. Only devices with matching Mesh IDs can communicate with each other.

Different Mesh IDs minimize interference between multiple sets of devices operating in the same vicinity. When receiving a packet, the device checks Mesh ID, as it is encoded in the packet.

Parameter range 0 - 7 **Default 7**

Each Blu900 mesh has a **SINGLE** coordinator which is *typically* the Blu900 Gateway.

## # 4 : RSSI and Radio Tx Power

**RSSI**, or “Received Signal Strength Indicator,” is a measurement of how well your device can hear a signal from an access point or router. It’s a value that is useful for determining whether you have enough signal to achieve a reliable wireless connection. For any Blu900 device the **RSSI** value indicates the 900MHz signal strength of the last/proximal hop. It does not provide an accurate quality measurement for a multi-hop link. A multi-hop network will only be as robust as its weakest link.

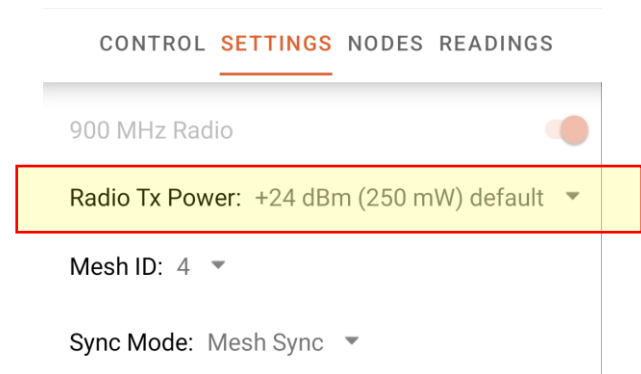

**Tx Power Level** setting sets/displays the power level at which the radio transmits conducted power. The **Tx Power Levels** are approximate.

Tx Power level	dBm (Power)
0	+7.0 dBm (5mW)
1	+15.0 dBm (32mW)
2	+18.0 dBm (63mW)
3	+21dBm (125mW)
4	+24dBm (250mW)/default

**INCREASING Tx Power level will increase RSSI**

**RSSI (dBm):**

>-60      Good  
 -60 to -80      Moderate  
 <-80      Poor

## # 5: Mesh Cycle Settings

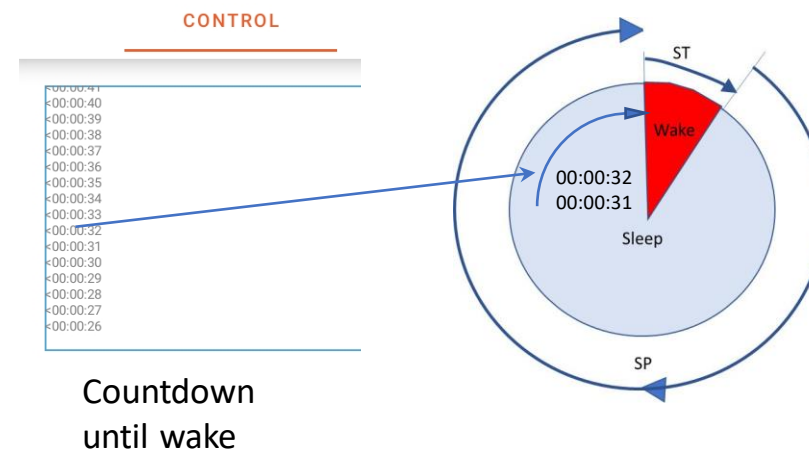

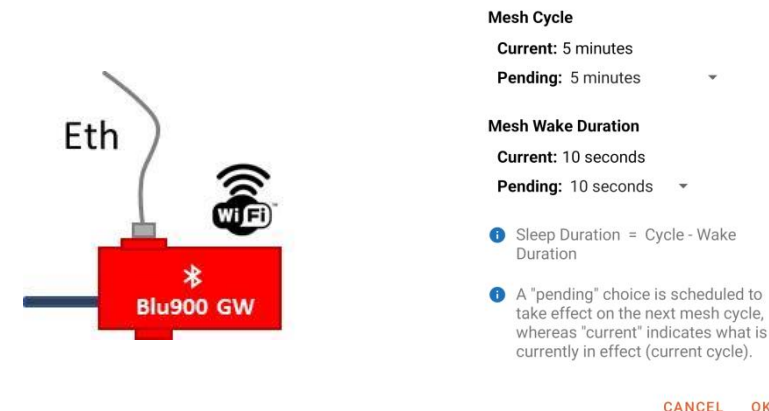

The mesh is synchronous so that all nodes wake up at the same time. Mesh Cycle can only be set on the Blu900GW (mesh role: Coordinator).

Sleep Duration (SP) Sets or displays the mesh's sleep time. This command defines the amount of time the mesh sleeps per cycle.

Wake Duration (ST) defines the amount of time that a device stays awake when operating in cyclic sleep mode. The command adjusts the value upwards automatically if it is too small to function properly based on other settings.

Mesh Cycle = Sleep Duration + Wake Duration

If a mesh has formed, the **MeshPoint** activity in **BluPoint** will count down to the next wake-up event. Otherwise, the mesh status will be *no mesh*.

# # 6: Mesh Cycle Operation

- **Mesh Cycle** is configured by the Blu900 Coordinator (SETTINGS tab)
- When a mesh is asleep the Blu900 nodes are not accessible
- The Blu900GW can only set the “operational” mesh cycle when the mesh wakes up. Until then the mesh Cycle is **Pending**
- Until the Mesh wakes up the Mesh Cycle settings can only be set once the mesh wakes up.
- If the Blu900GW is powered cycled while the mesh is asleep the mesh cannot ‘heal’ until the nodes wake up. Until then there will be *no mesh*

The **Mesh Cycle** should not be confused with the instrument **Reading Interval**. There may be several readings during each mesh cycle (see Principle 7 below). The mesh Cycle and reading interval can be synchronized or not using **Sync Mode**

MeshPoint > SETTINGS > Mesh Cycle

## Mesh Cycle

Current: 5 minutes

Pending: 5 minutes

## Mesh Wake Duration

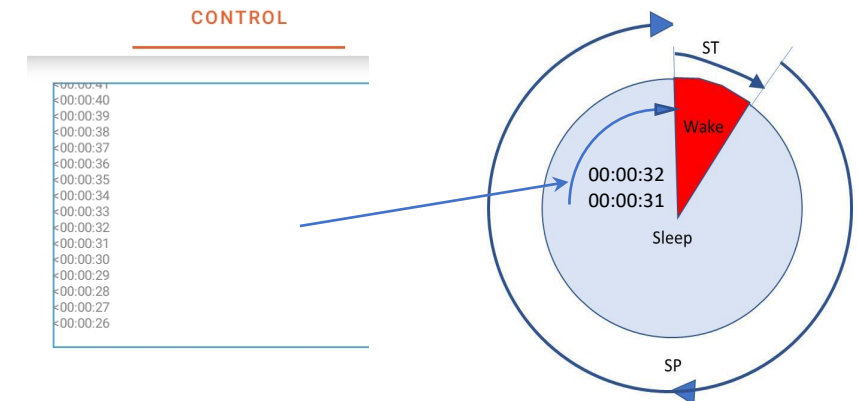

Current: 10 seconds

Pending: 10 seconds

1 Sleep Duration = Cycle - Wake Duration

1 A "pending" choice is scheduled to take effect on the next mesh cycle, whereas "current" indicates what is currently in effect (current cycle).

CANCEL OK

# # 7: Mesh Cycle/ Reading Interval Synchronization

The reading interval for Blu900 Nodes can be set in three ways which must be configured on the Blu900GW:

- (i) **MESH SYNC (sync\_mode=2).** Full Synchronization between Mesh Cycle and Reading Intervals. 1 reading /mesh cycle. Set on Blu900GW (**Default**).
- (ii) **GATEWAY SYNC (sync\_mode=1).** Gateway dynamically controls Reading Interval but this is decoupled from Mesh Cycle.
- (iii) **NODE SYNC (sync\_mode=0).** Reading Interval set by the BluPoint App on each individual node. Reading Interval set to NODE\_SYNC on Gateway.

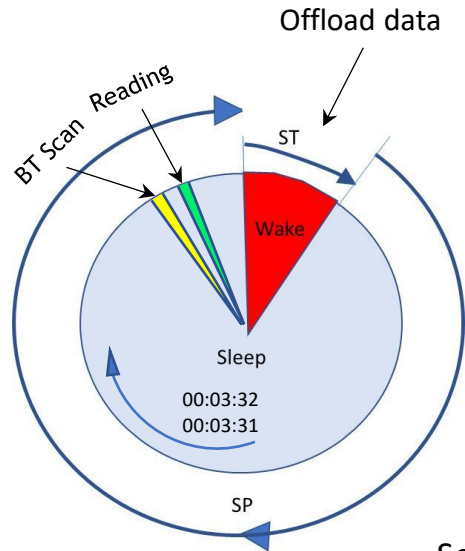

**MESH SYNC** is the most SIMPLE. **GATEWAY SYNC** allows reading intervals to be modified remotely depending on ground conditions. **NODE\_SYNC** can be used to more finely manage battery life on individual nodes.

# # 7: Mesh Cycle/ Reading Interval Synchronization

All Nodes are synchronized by Blu900GW

**MESH SYNC.** 1 Reading /mesh cycle.

**GATEWAY SYNC.** Gateway dynamically controls reading Interval but this is decoupled from the Mesh Cycle.

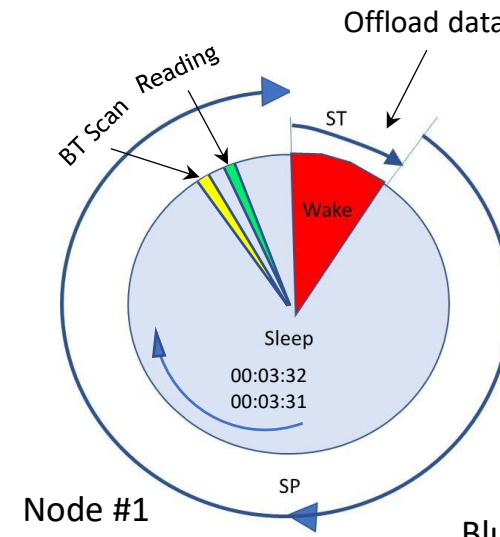

sync\_mode=2

sync\_mode=1

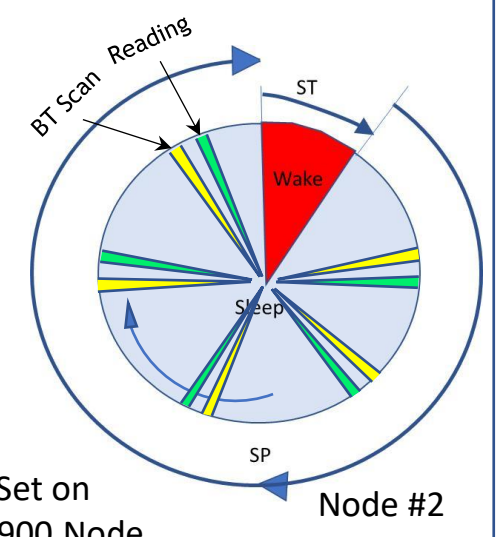

Nodes are independently synchronized

**NODE SYNC.** Reading Interval set by the BluPoint App on each individual node. sync\_mode set to **NODE SYNC** on Gateway.

Node #1

sync\_mode=0

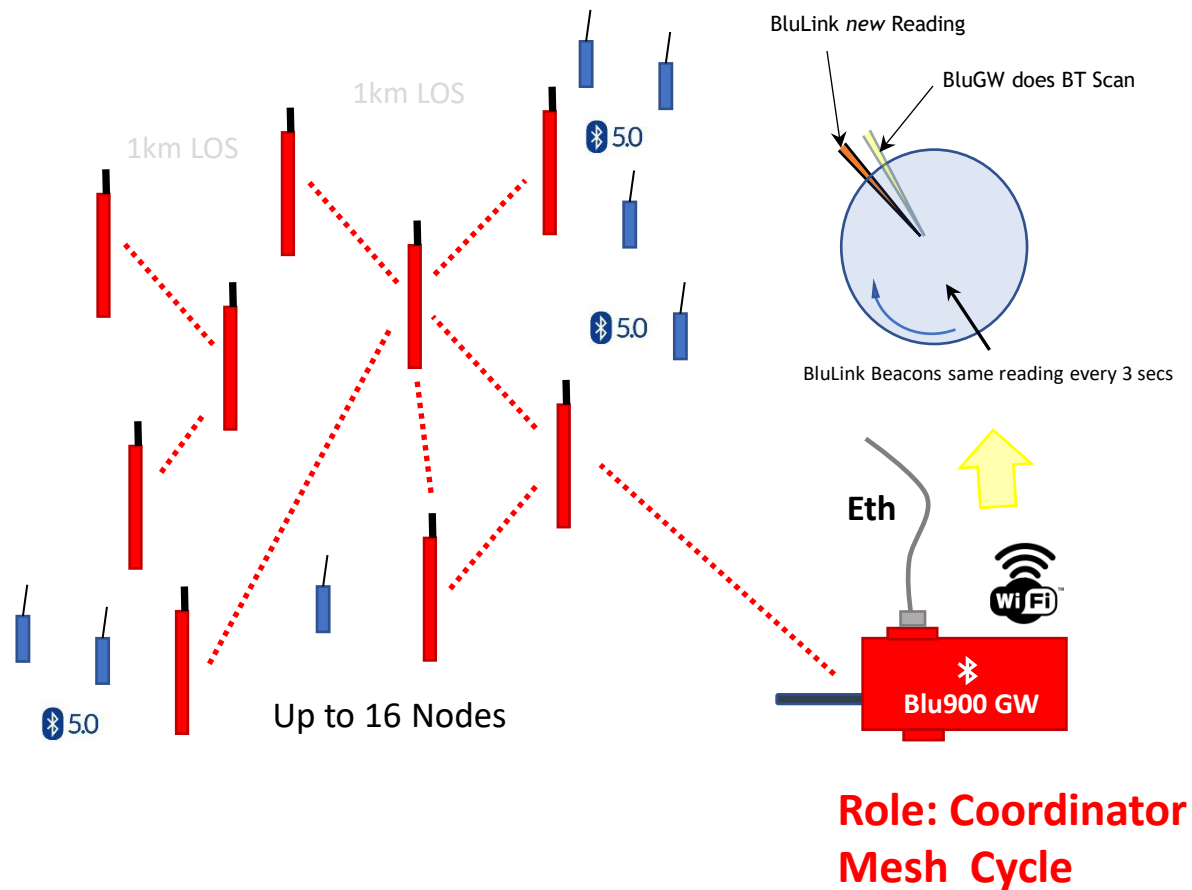

Set on  
Blu900 Node

Node #2

sync\_mode is set on Blu900GW.

# # 8: BluLinks on a Blu900 mesh

A BluLink takes a new reading based on its **Reading Interval** setting. Then it “beacons” the same reading every 3 seconds until the next reading is taken.

Blu900 Nodes can listen to beacons from nearby BluLinks, and will transmit the data when the mesh wakes up.

If the BluLink is within range of a parent Blu900 device, Blu900GW or Blu900 Node, in order to have a *new* reading each time its parent executes a BT Scan, the BluLink will synchronize its **Reading Interval** to that of the parent.

The parental **Reading Interval** is in turn set by configuring **sync\_mode** on the Blu900GW.

# # 9: Mesh Optimization and max\_tx Setting

Blu900 Mesh optimization is a compromise between (i) battery life (ii) the number of readings (iii) the mesh topology.

Battery life is primarily affected by the Mesh Cycle settings.

$$\text{Mesh Cycle} = \text{Mesh Sleep Time} + \text{Mesh Wake Time}$$

Increasing the **Mesh Cycle** will result in more readings to send each time the mesh is awake. **Mesh Wake Time** of the Blu900 mesh is 10sec by default. The longer the mesh is awake the more readings that can be sent at one time. If remaining time is insufficient then the readings will be buffered.

**max\_tx (8-32, default=8)** sets the maximum number of readings sent during mesh wakeup. This setting help control traffic on the mesh. A higher **max\_tx** may require a longer **Mesh Wake Time**.

Large complex mesh topologies involving many radio hops with low signal strength (RSSI) are inefficient and result in a *low packet transmission rate*. In such cases the wakeup time may need to be increased.

**Mesh Cycle**  
Current: 5 minutes  
Pending: 5 minutes ▾

**Mesh Wake Duration**  
Current: 10 seconds  
Pending: 10 seconds ▾

**i** Sleep Duration = Cycle - Wake Duration

**i** A "pending" choice is scheduled to take effect on the next mesh cycle, whereas "current" indicates what is currently in effect (current cycle).

Quick actions

# The Settings Tab

The SETTINGS tab is used to configure the 900MHz mesh network

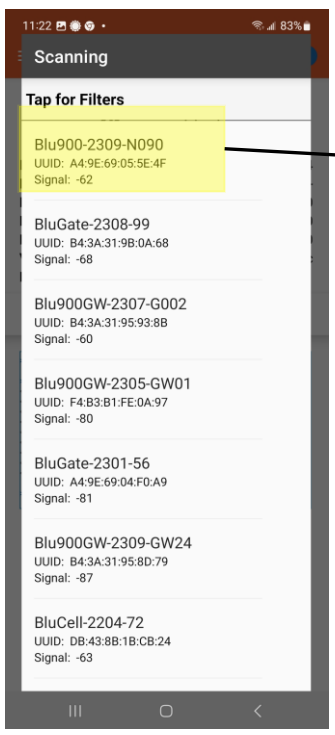

- Mesh ID
- Sync mode: Mesh, Gateway, or Node sync
- Instrument Reading interval: Only in Gateway and Node Sync
- Turn on/off scheduled BT instrument reading scanner
- Turn on/off RS485 instrument reading (Node only)
- 900MHz radio power
- Mesh Cycle (sleep and wake time)
- Maximum number of readings set on a single mesh cycle wakeup. A higher number may require a longer Mesh Wake Time

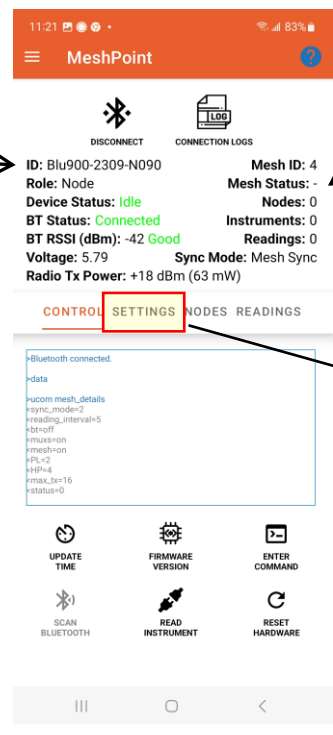

# Connect to and Set all Nodes to the same MeshID

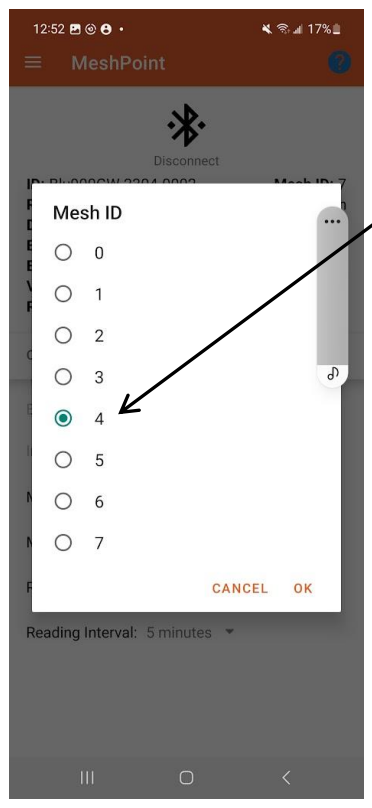

If no mesh countdown starts, use Bluetooth to connect to the Blu900 Node and set the **Mesh ID** under the SETTINGS tab to the same as the Blu900GW

Connect to Blu900 Node

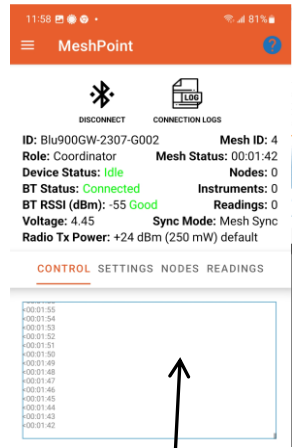

No countdown

Set Mesh ID

Mesh ID for Node must match that for Gateway(4)

Node has joined mesh. Mesh will wake in 1m42s. Counting down.

# Set the Mesh Cycle on a Blu900GW

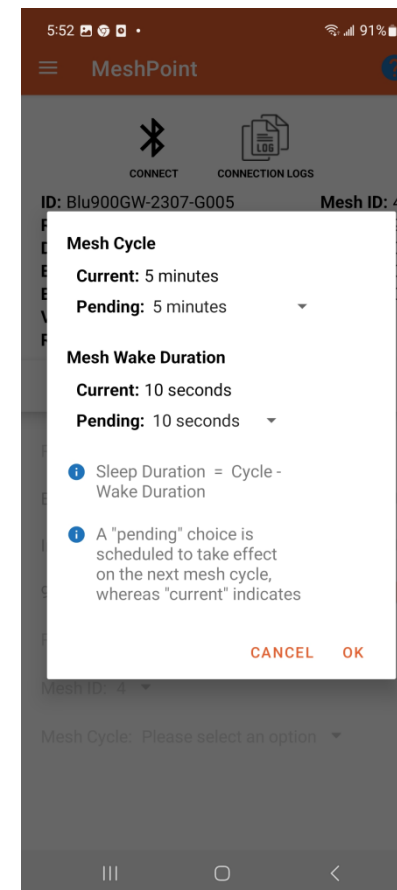

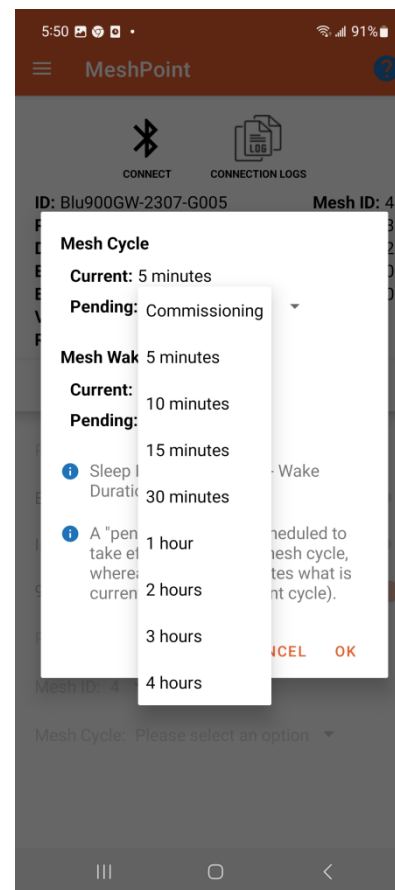

The Mesh Cycle can only be set on the Blu900GW

A 2 min mesh Cycle will quickly drain the battery. Battery life-time is primarily dependent on the Mesh Cycle (i.e. the ratio of wake and sleep time, or more precisely the Duty Cycle).

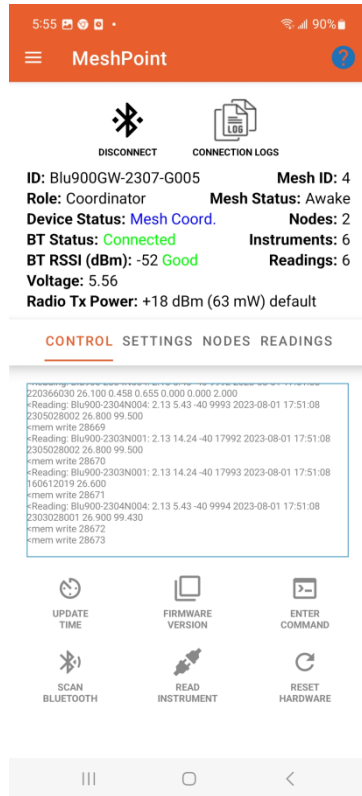

A 1hr Mesh Cycle will have the mesh asleep of 59min 50s and awake for 10s. That's a duty cycle of 1/360.

Pending status:

When a different mesh cycle is selected the values do not take effect until the mesh wakes up. Until then the changes are **“Pending”**

Following each count-down the mesh will (i) enter a 10s Mesh wake preparation, then (ii) wake up. If an instrument is connected or in BT5 range of the node the reading will be transmitted over the mesh.

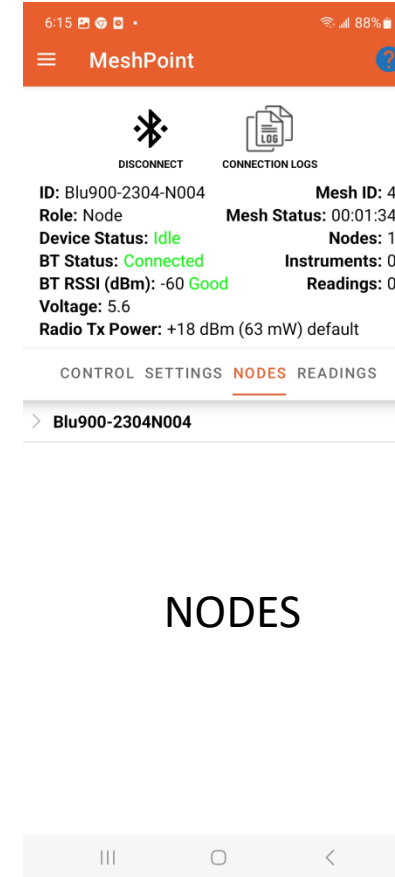

After one cycle the READINGS and NODES tabs will populate

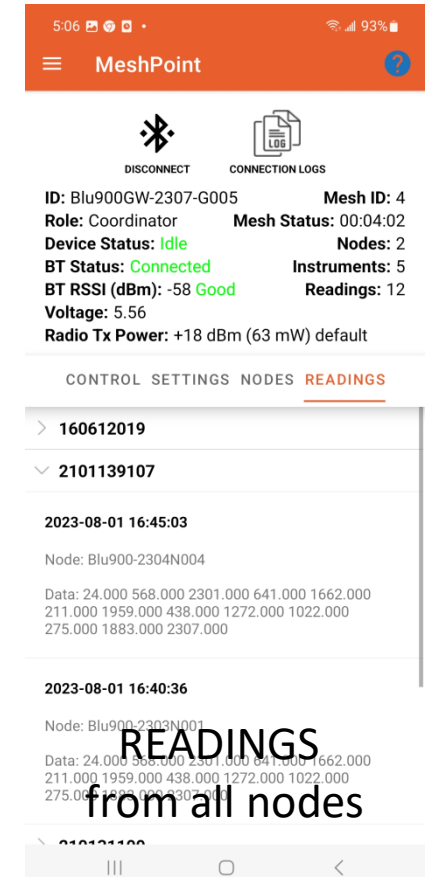

```

NODES

READINGS from all nodes

# Reset the mesh cycle to Commissioning when it already exists

Recommendations:

1. It is highly recommended that the user select a **Mesh Cycle** time and leave the mesh running like that indefinitely. **Hyper-managing a Blu900 mesh is not recommended.**
2. **Mesh Sync** is the simplest and most reliable synchronization setup, especially for inexperienced users. Node Sync is only recommended for final mesh optimization.
3. GateWays and nodes come configured with:
  - mesh ID = 0,
  - sync mode = mesh sync (2)
  - mesh cycle = commission mode (2 min Mesh cycle)

When a synchronized mesh is Sleeping it is not reachable through the Blu900 mesh and in order not to lose its nodes a coordinator can only change cycle time at the next wakeup.

The way to force a change in Mesh Cycle for a GW coordinator is to power cycle the gateway. It will then be necessary to power cycle the nodes by toggling the 900MHz radio.

# The MeshPoint Activity: Connect to a Node: CONTROL Tab Status

The screenshot displays the MeshPoint application interface. At the top, the status bar shows the time (6:18) and battery level (88%). Below the title bar, there are icons for DISCONNECT and CONNECTION LOGS. The main content area is divided into two columns of status information:

- Left Column:**
  - ID: Blu900-2304-N004
  - Role: Node
  - Device Status: **Idle**
  - BT Status: **Connected**
  - BT RSSI (dBm): -59 **Good**
  - Voltage: 5.6
  - Radio Tx Power: +18 dBm (63 mW) default
- Right Column:**
  - Mesh ID: 4
  - Mesh Status: 00:01:13
  - Nodes: 1
  - Instruments: 0
  - Readings: 0

Annotations with arrows point to these fields:

- Hardware ID: points to ID: Blu900-2304-N004
- Role in Blu900 mesh: points to Role: Node
- BT5 status/RSSI: points to BT Status: Connected and BT RSSI (dBm): -59 Good
- Mesh ID: 0-7 Default 0: points to Mesh ID: 4
- Mesh Status: HH:MM:SS Countdown to wake-up: points to Mesh Status: 00:01:13

Below the status information is a **Console** window showing a list of timestamps from 00:01:13 to 00:01:26. At the bottom, there is a **Quick actions** panel with six buttons: UPDATE TIME, FIRMWARE VERSION, ENTER COMMAND, SCAN BLUETOOTH, READ INSTRUMENT, and RESET HARDWARE.

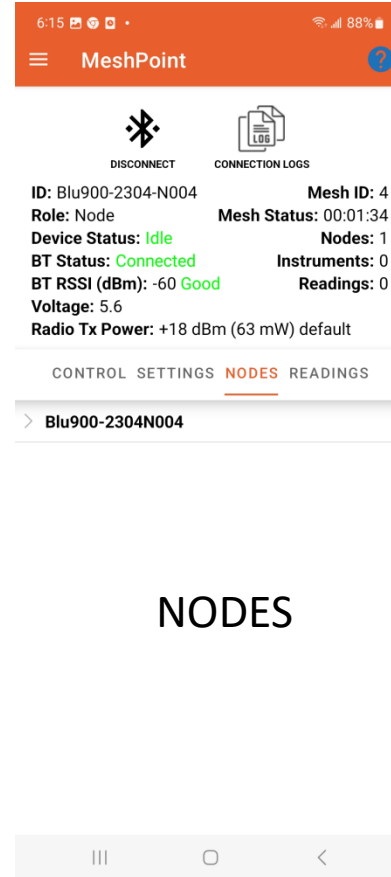

# The MeshPoint Activity: Connect to a Node : SETTINGS tab

# MeshPoint: GW Browser Configuration

The image shows a mobile browser interface on the left and a larger desktop view on the right. The mobile view shows the YieldPoint logo, a navigation menu with 'NetPoint' and 'MeshPoint', and a 'Mesh Details' section with fields for Gateway ID (Blu900GW-230), Gateway Type (Wi-Fi/LAN), and Voltage (4.45). A yellow arrow points from the mobile view to the desktop view. The desktop view shows the 'Mesh Details' section with the following fields: Gateway ID (Blu900GW-2307-G002), Gateway Type (Wi-Fi/LAN), Voltage (4.50), a 'SETTINGS' button, Reading Interval (5 Minutes), Mesh ID (4), Mesh Cycle Current (5 Minutes), Mesh Cycle Pending (5 Minutes), Mesh Wake Durration Current (10 Seconds), Mesh Wake Duration Pending (10 Seconds), and Radio Tx Power (+24 dBm (250 mW)). At the bottom are 'RELOAD' and 'APPLY' buttons.

Battery Voltage tracking Temperature for 4 x Tadiran D-cell lithium batteries

## MODEL TL-4930

International size reference: D, ER32L615

### TECHNICAL DATA

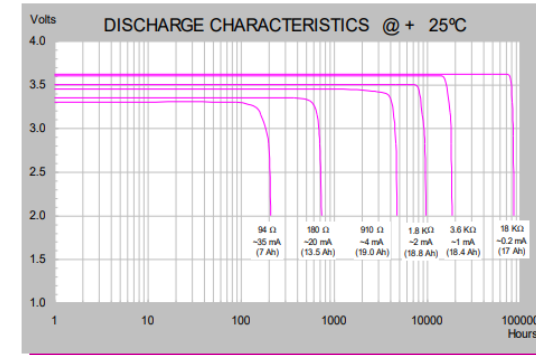

(Typical values @+25°C for batteries stored for one year or less)

- Nominal capacity @ 4 mA, to 2 V 19 Ah
- Rated voltage 3.6 V
- Maximum recommended continuous current 100 mA
- Maximum 1 sec. pulse capability 250 mA
- Weight 93 g (3.28 oz)
- Volume 51 cc
- Operating temperature range -55 °C to +85 °C
- IEC 60086-4 certified
- U.L. Component Recognition, MH 12193

### AVAILABLE TERMINATIONS

SUFFIX: /S STANDARD 15-4930-21000  
SUFFIX: /T SOLDER TABS 15-4930-31000

# Update firmware on Blu900 GW and Node

The appropriate Blu900 Firmware for the both the Blu900GW and Blu900Node is bundled with the BluPoint Firmware

1: Open OTA (Over the Air) Update Activity

2: Connect to a GW or Node

3: Tap Firmware and select the bundled file to start the upload process

4: Wait for OTA Update to complete

RUN the CUSTOM commands:

ucom preset

ucom get\_mac

```
>ucom get_mac
<lan_mode=DHCP
<eth_mac=0cb8154ade9b
<lan=on
<wifi=on
<wf_mode=DHCP
<wifi_mac=0cb8154ade98
```

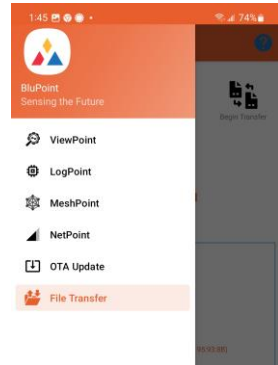

5: Reconfigure

**IMPORTANT:** Always check all settings after a firmware update

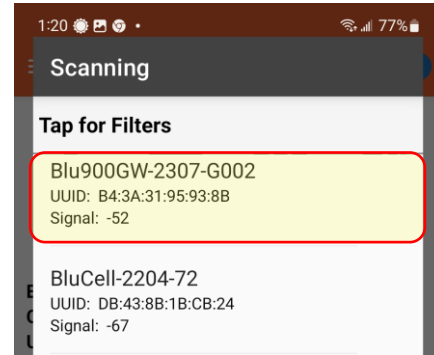

# Update firmware ESP32 WiFi/Ethernet modem

The ESP32(WT32) WiFi update comes bundled with the BluPoint App.

**POWER CYCLE the Gateway**

7

# Best Practice: Restart a Blu900 mesh after OTA/FW Update.

Open BluPoint and connect to the GW using the **MeshPoint** Activity

GW {

The screenshot shows the MeshPoint application interface. At the top, there's a status bar with the time 4:44 and battery level 95%. Below that, the title 'MeshPoint' is displayed. The main area shows device information for a Blu900GW-2307-G005, including its role as a Coordinator, Mesh ID of 4, and various status indicators like 'Device Status: Idle', 'BT Status: Connected', and 'Radio Tx Power: +18 dBm (63 mW) default'. Below this, there are tabs for 'CONTROL', 'SETTINGS', 'NODES', and 'READINGS'. A log window is open, showing a series of timestamps from +00:00:37 to +00:00:50. At the bottom, there are several control buttons: 'UPDATE TIME', 'FIRMWARE VERSION', 'ENTER COMMAND', 'SCAN BLUETOOTH', 'READ INSTRUMENT', and 'RESET HARDWARE'. The 'UPDATE TIME' and 'FIRMWARE VERSION' buttons are circled in red.

2.Update time

1. Check version

3. Make sure the **Mesh\_ID** is correct

4. Set sync mode to **Mesh Mode**

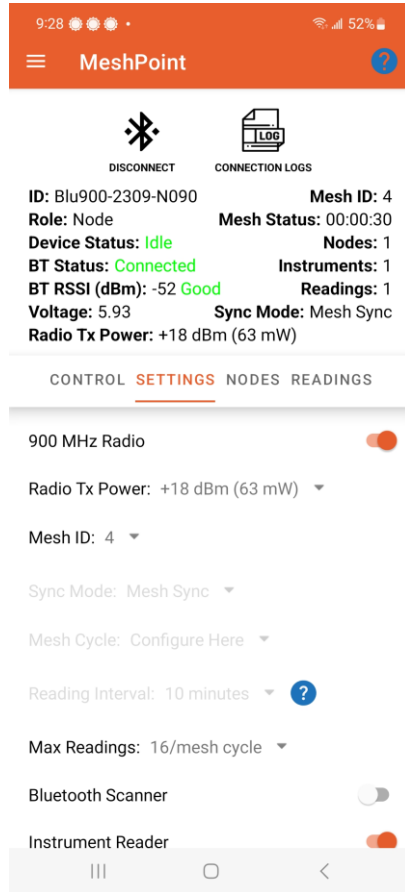

5. Set Mesh Cycle to commissioning (2min cycle)

6. Set the **Tx\_Power** to 250mW(default)

7. Configure the Bluetooth Scanner/Instr Reader as required

8. Power cycle the Blu900GW

# Best Practice: Restart a Blu900 mesh after OTA/FW Update.

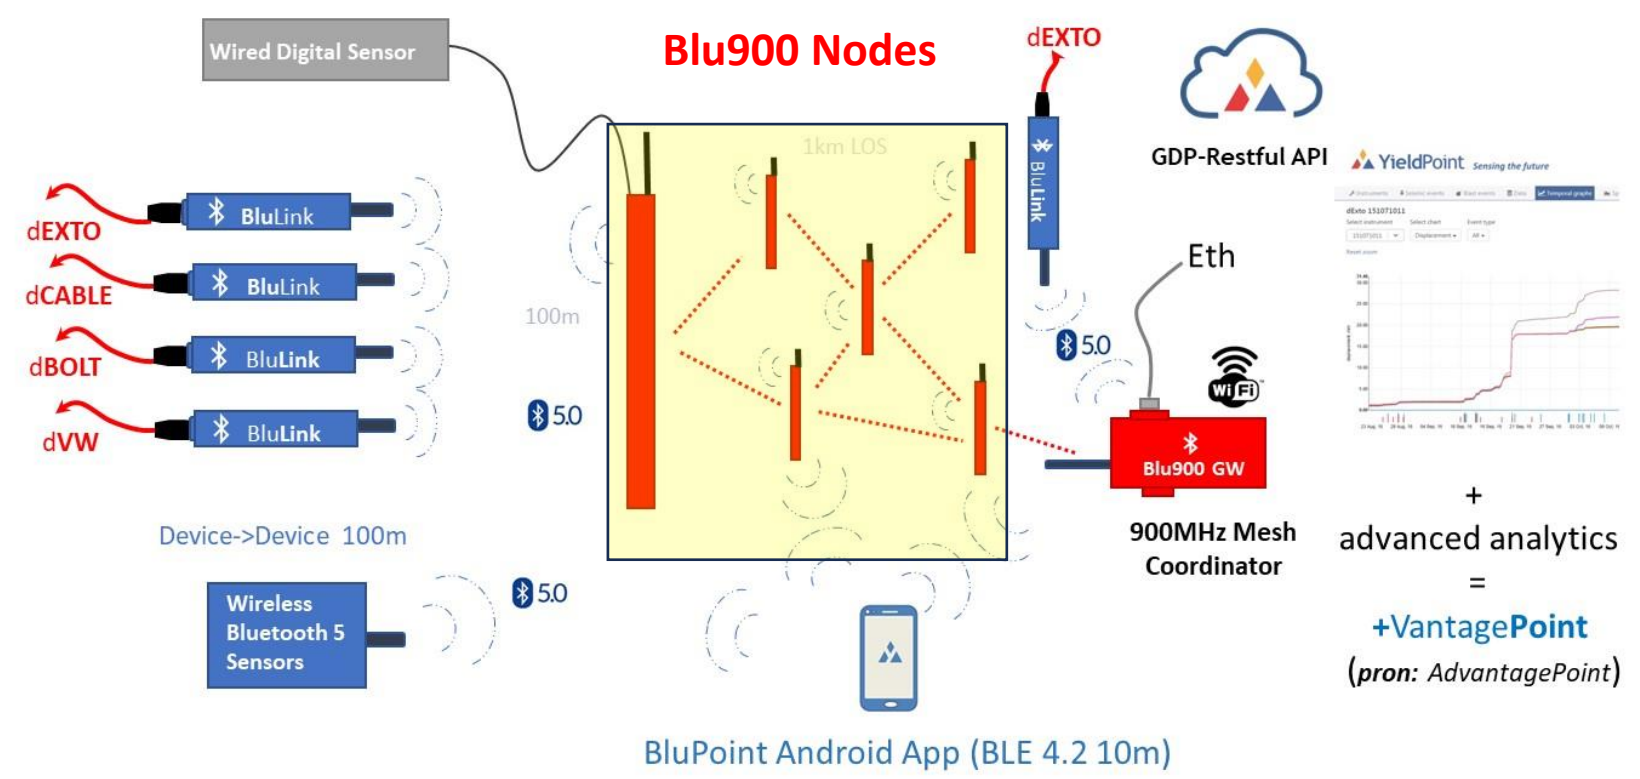

9. Connect to the Blu900 Nodes with MeshPoint

- (i) Toggle the 900MHz radio. The radio will reboot and the mesh status will indicate “Sleep” but it will not count down.
- (ii) Upon mesh wakeup the node will join the mesh and will count down while asleep.

**REPEAT for each node.**

Even if the nodes are not power cycled, they will *eventually* join the mesh.
